Retail Business Rhythms
The Revamp

One source of truth, refreshed several times a day

Feb 2023

RBR became the go-to dashboard, so we rebuilt it end to end

After the dashboard became widely used, it was rebuilt, back end and front end, to raise quality, improve the experience and refresh several times a day.

Data Engineers | **BI Developers** | **Analysts** → **One source of truth**
the RBR dashboard

Goals

1 Accuracy

Logic validated against Merchandising, Finance and Retail

2 Better experience

Pages re-visualized with clearer views and visuals

3 Refreshed several times a day

Always current, not a once-a-day snapshot

What changed: 4 logic fixes, 7 pages touched, 3 left alone

4

logic changes validated against other departments

4

pages adjusted

3

new pages

3

pages kept as they were

Result: one RBR dashboard that every team can trust, refreshed several times a day.

Four logic changes, each validated against another department

1 Categories

Validated with Merchandising

Product categories now match the merchandising team's classification.

2 Channels

Validated with Finance

Sales channels now match the finance team's definition, so the numbers agree across departments.

3 Air conditioners

Validated with Retail figures

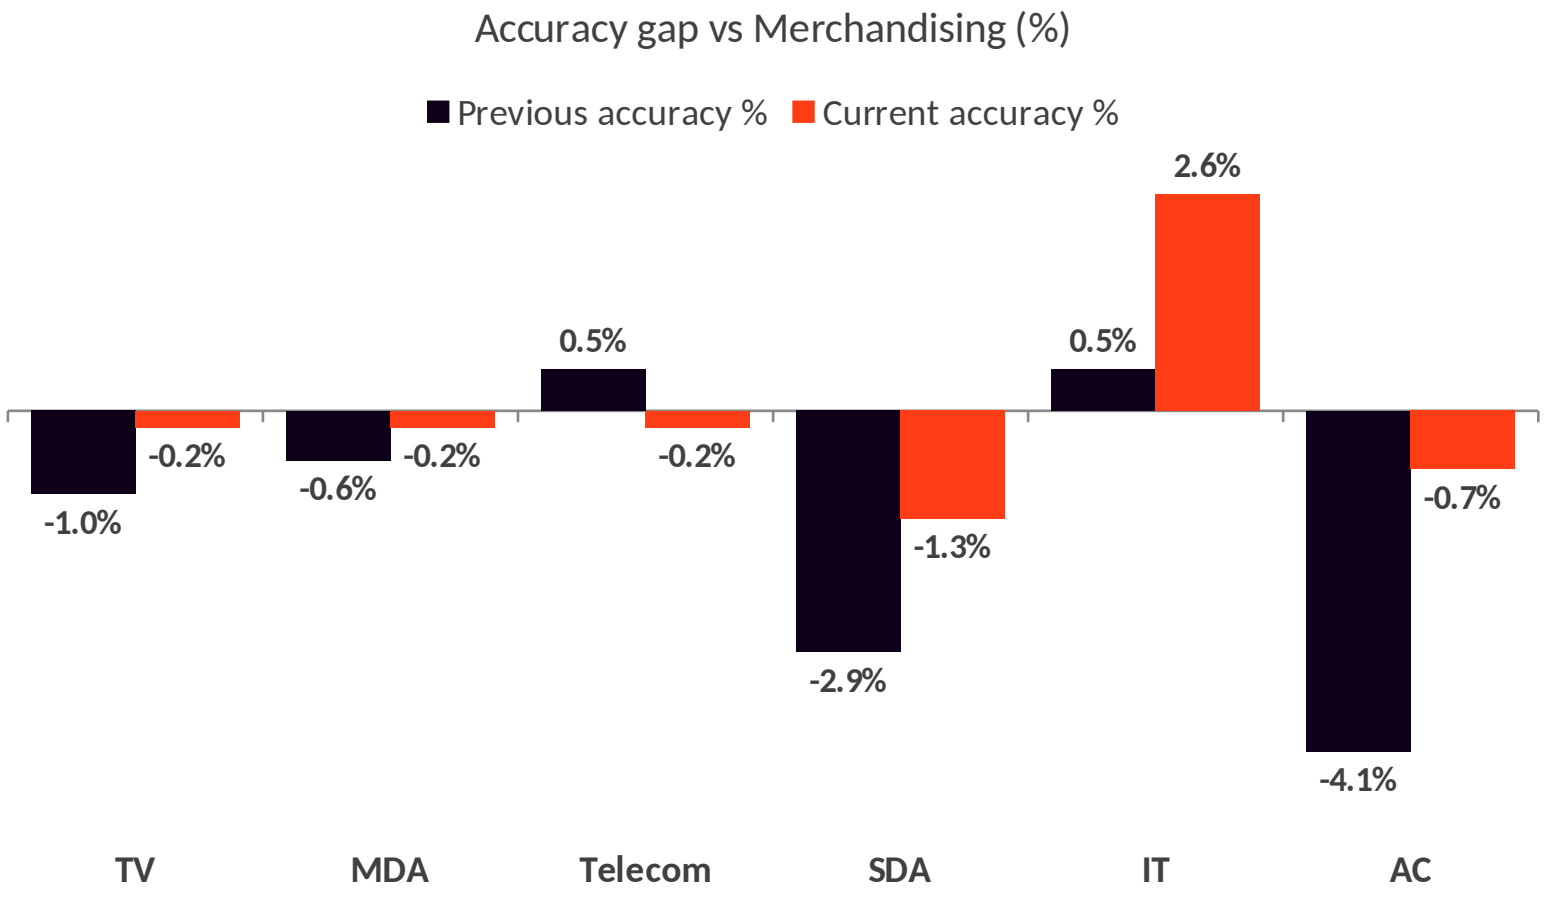

AC quantities are counted by assembly code. This fixes AC quantity and ASP, and the company-wide ASP.

4 Traffic

Validated with Retail team

Traffic excludes new warehouses. Store leadership and clusters follow the latest retail allocation.

Category gaps vs Merchandising narrowed in 5 of 6 categories

AC **-4.1% to -0.7%**

Biggest improvement

SDA **-2.9% to -1.3%**

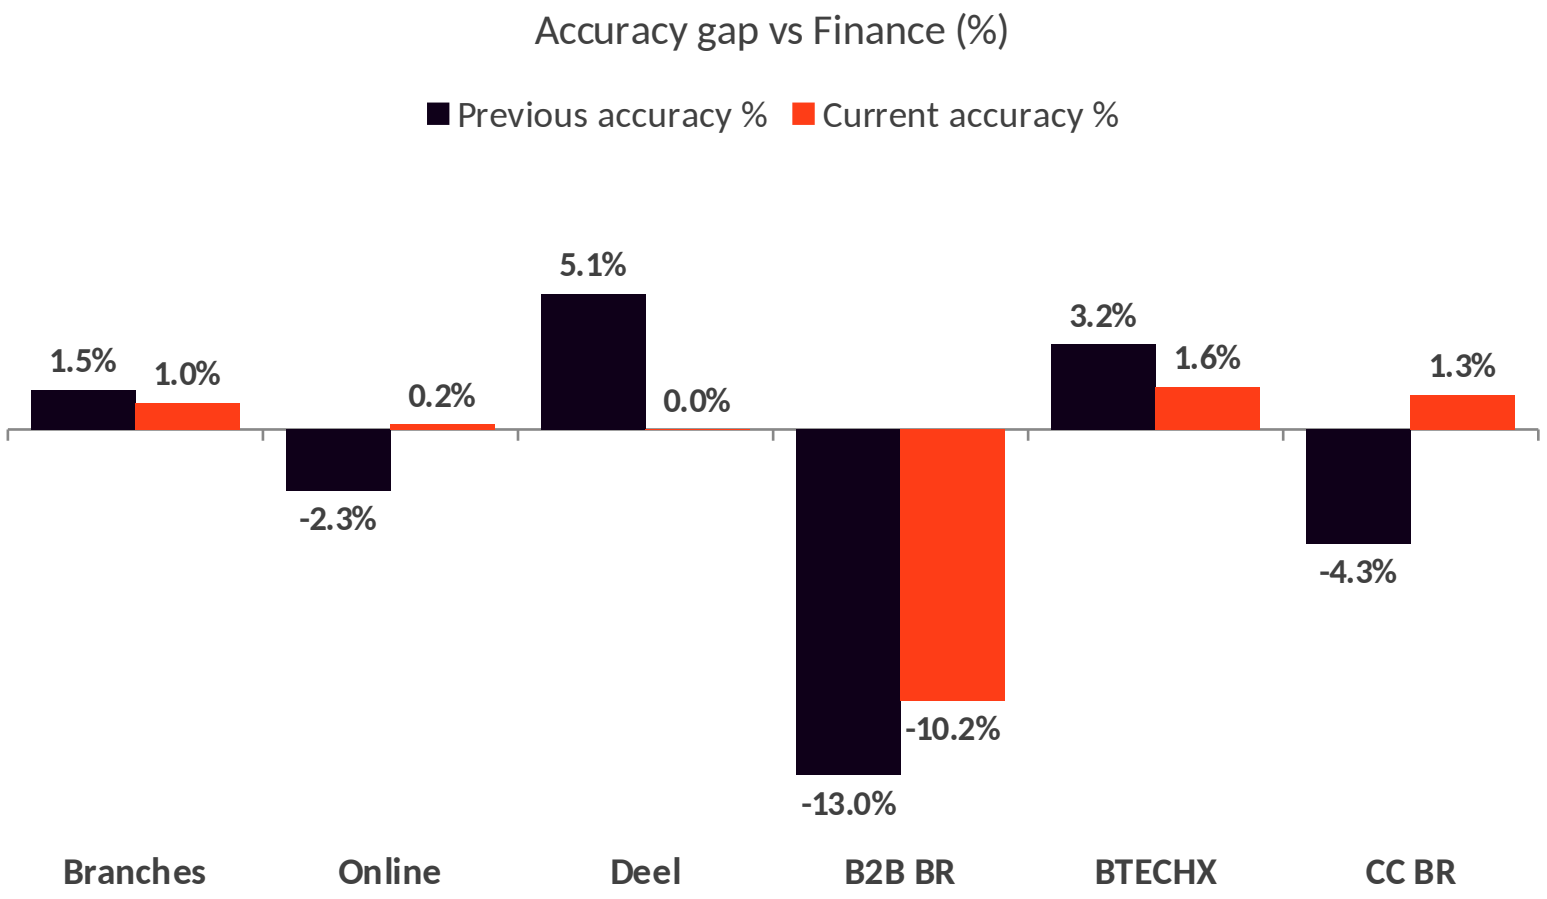

Gap more than halved

IT **+0.5% to +2.6%**

Only category that moved away; improvement continues

Validation covered sales from 1st to 30th of January 2023.

Channel gaps vs Finance narrowed in all six channels

Deel 5.1% to 0.0%

Now matches Finance

Online -2.3% to +0.2%

From a gap to near zero

B2B BR -13.0% to -10.2%

Still the largest remaining gap

Validation covered sales from 1st to 28th of January 2023.

Counting AC by assembly code lifted AC ASP from 3,497 to 10,380

1. AC quantities were counted by item code, so AC accessory SKUs were counted as units.
2. They are now counted by assembly code, which fixes AC quantity and AC ASP.
3. The company-wide B.TECH ASP is corrected too.
4. Validated against retail figures.

Before	Revamped RBR
3,497 AC ASP before adjustments	10,380 AC ASP (3.0x)
2,489 Overall ASP before adjustments	4,798 Overall ASP (1.9x)

Traffic now excludes new warehouses and follows the latest allocation

1 New warehouses out

All new warehouses are removed from traffic calculations.

2 Latest allocation

Store leadership and clusters follow the latest allocation from the Retail team.

3 Misallocated stores fixed

Four stores whose traffic was misallocated were corrected.

January impact on the four corrected stores (revamped vs old RBR)

-47 to -89
traffic per store

-0.7 to -1.8 pts
conversion

-38 to -210
transactions

Dashboard changes: 4 pages adjusted, 3 new, 3 kept as they were

Adjusted pages	New pages	Kept as they were
Executive overview	Root Cause	Store Morning Brief
Trends	Comparatives	Traffic Details
Region / Category / Brand analysis	Volume Analysis	Week over Week
Top SKUs (now its own page)		

Executive overview: see exactly what drove a change in sales

Shows whether a MOM or YOY change was driven by:

Total Sales	=	**Invoices**	x	**AOV**
Total Sales	=	**Quantity**	x	**ASP**

Rest of the page

- Channel / Region / Category contribution
- Noon vs BTECH
- Cash vs MC
- Agencies vs Domestic

How to read it

A plain-language sentence on the page explains each change, for example: sales moved because invoices went down while AOV went up.

Trends: more views on Cash and Mini-Cash, and on contribution over time

Total Sales Current vs previous year	**Cash Sales** Current vs previous year	**Mini-Cash Sales** Current vs previous year	**Cash / MC contribution** Over time
Total Volume Current vs previous year	**Cash Volume** Current vs previous year	**Mini-Cash Volume** Current vs previous year	**Category contribution** Over time

Filter by

Category | Subcategory | Brand | Deel | Region | Store name

Store leadership | Cluster

Region, category and brand analysis: heat maps and top / bottom movers

Heat maps answer

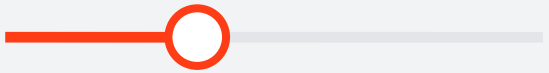

1. Which hours have the highest traffic, across all days?
2. Which day has the highest traffic or conversion, across all stores?

Store, category and brand views

1. Store / category / brand sales contribution
2. Top 10 YOY %
3. Bottom 10 YOY %
4. Cash and MC contribution

Top SKUs now has its own page, with ASP for a price perspective

Pick the Top SKUs %

The user selects the share of SKUs to treat as Top SKUs.

Top SKUs
number of SKUs and % of sales

Bottom SKUs
number of SKUs and % of sales

ASP added
to show the price level of the chosen SKUs

Why a separate page
On its own page, Top SKUs gets the room for the 80/20 view: how few SKUs carry most of the sales, and at what price.

Root Cause: which region, category or channel caused the change

Drill down from the YOY or MOM change in value:

Change in value → Customer type → Channels → Category → Region

...in terms of:

AOV | ASP | Invoices | Quantities | **Sales** | Traffic KPIs

Instead of asking an analyst, anyone can see which region, category or channel moved the number.

Comparatives: regional and category views side by side

Regional comparisons | **Categorical comparisons**

Both compare:

1	**Sales and Volume**	How big each region or category is
2	**YOY and MOM change**	How each one moved vs last year and last month
3	**Cash and MC contribution, and AOV**	How customers pay and how much they spend

Volume Analysis: quantities in tabular form, four ways

1 Cash and MC

MOM and YOY, at total level and across categories

2 Category

At total level and across subcategories

3 Brand / Category

Quantities for each brand within each category

4 Channel / Branch

Quantities by channel and by branch

Three pages stayed exactly as they were

Unchanged

Store Morning Brief

Same layout and logic as before.

Unchanged

Traffic Details

Same layout and logic as before.

Unchanged

Week over Week

For monitoring marketing campaigns: WOW analysis per category and region, for the week the user selects.

No changes to layout or logic on these pages.

IN SUMMARY

One source of truth: accurate, easier to use, refreshed through the day

Accurate

- Categories match Merchandising
- Channels match Finance
- AC counted by assembly code
- Traffic follows the latest allocation

Easier to use

- 4 pages adjusted
- 3 new pages: Root Cause, Comparatives, Volume Analysis
- Top SKUs on its own page

Always fresh

- Refreshed several times a day
- Built with data engineers, BI developers and analysts
